70 questions

Read the following passage carefully and answer the questions given below it. Certain words have been given in bold to help you locate them, while answering some of the questions. India's consumer behaviour has experienced a radical transformation at the most fundamental levels. The rise in smartphone use fuelled by affordable data plans has catalysed an online revolution in the country. The novel coronavirus pandemic has further accelerated the process of digital inclusion, and it is now not only routine to transact online and have food, personal care items or anything else delivered at the one's doorstep, but it is also common to learn online, have medical consultations online, and even resolve disputes online. These realisations have given India the opportunity to disrupt the status quo with its innovative abilities. Despite the rapid advancement of digital platforms on the one hand and the pervasiveness of the Internet-enabled phone on the other, small enterprises such as local kirana stores have not gained from this. Online purchases from 'near and now' inventory from the local store remain in a digital vacuum. This is because, to sell on numerous platforms, sellers must maintain a separate infrastructure, which only adds costs and limits participation. The distinct terms and conditions of each platform further limit the sellers' flexibility. Consequently, small and medium-sized businesses have lost their freedom to choose and participate in the country's e-commerce system at their will and on their terms. Alarming, centralising digital commerce transactions on a single platform creates a single point of failure. Given this objective, the Department for Promotion of Industry and Internal Trade (DPIIT) of the Government of India established the Open Network for Digital Commerce (ONDC) to level the playing field by developing open e-commerce and enabling _____ to small businesses and dealers. The ONDC network makes it possible for products and services from all participating e-commerce platforms to be displayed in search results across all network apps. For instance, a consumer shopping for a product on an e-commerce app named 'X' would also receive results from e-commerce app named 'Y' if both X and Y integrated their platforms with the ONDC. This achieves the dual objective of wider choice for consumers on the one hand and access to a wider consumer base for sellers on the other.
