Read the following passage and answer the given questions below it with the help of the information provided in it. Screaming is a unique noise. Research suggests when we scream in fear, the noise serves the dual purpose of sharpening our own focus in the face of a threat as well as of warning others. In fact, our brains process screams in a unique way. Most noises we hear are delivered from our ear to an area of the brain devoted to analyzing a sound and breaking it into its component parts, such as gender, age, and tone; high or low; a brass, stringed or electric instrument ? or several combined; a ribbit or a coo, and what animal makes that sound. This indicates that we differentiate all the noises we hear everyday, even subconsciously. A scream is different though, according to David Poeppel, PhD, a professor of psychology and neural science at New York University. Poeppel is the lead author of a 2015 study that looked into what happens in the body when people scream in fear. A scream goes straight from the ear to the amygdala, the part of the brain that processes fear and kickstarts the body's fight-or-flight response. The sound jolts our brains into increased alertness and analysis. This is especially true for screams when we're scared. These have a unique sound signature encompassed by the term "roughness." This roughness is what serves to alert others to danger. Humans and other animals scream for many reasons ? in joy, in surprise, in fear. But we've evolved to be able to produce different shrieks and to be able to discern the difference when we hear them. (Incidentally, roughness is also why we find the sound of a baby crying and fingernails on chalkboards disturbing; both sounds have high roughness.) If we focus on the sounds that gain our attention, we will be able to tell which one is rough and which is not. But what about people who have the opposite reaction when they're scared? What about the people who don't scream in fear, but become speechless in the face of a threat? This has been less studied, but it's likely a part of the third, overlooked response to terror: paralysis. Contrary to pop medicine, fight and flight aren't the only two reactions to something scary. Humans, like other animals, also evolved the option to freeze, or "play dead" in the face of a threat. This happens involuntarily, when the cerebellum, the part of the brain that regulates muscle activity, overpowers other terrified brain responses and basically shuts down all movement.

24. Choose the statement(s) which is/are correct based on the information given in the passage. (I) Our systems are built in a way that only allows us to scream in dangerous or threatening situations. (II) One of the ways humans tackle fear is by going into a freeze mode and acting dead which is a similar action to animals. (III) The brain sorts the noises we hear regularly on the basis of factors such as gender or high or low tone, age, etc.

- (a) Both II and III
- (b) Both II and I
- (c) Only III
- (d) Both I and III
- (e) Only I

25. According to the article, what contributes to alerting someone of the danger a person is in?
- (a) The gestures and expressions we make when we are confronted with a seemingly dangerous situation.
 - (b) The scream one lets out when faced with danger holds an element of roughness which is crucial for letting others know of the possible danger.
 - (c) Secretion of certain fluids and juices in our bodies by our organs play a part in accomplishing the above said thing.
 - (d) The frequency of our screams, i.e., how often we shout in the given amount of time can alert others of the presence of danger.
 - (e) None of the above
-
26. Among the following statements, choose option(s) which are FALSE in accordance with the information given in the passage. (I) The part of the brain that understands the fear of the situation and sends us into a full blown fight/flight response is called amygdala. (II) The number of muscles used in the process of speaking are over 100. (III) The purpose of a scream is to vent out your anger and release the emotions a person has been withholding inside.
- (a) Both I and II
 - (b) Only III
 - (c) Only II
 - (d) Only I
 - (e) Both II and III
-
27. Choose the option which states the reason for why some people go mute when they are scared.
- (a) The brain finds it hard to concentrate between how to combat the dangerous situation and figuring out how to talk which leaves a person mute.
 - (b) Some people find that they don't want to express their feelings of terror and fright which is why they choose to remain quiet in those moments.
 - (c) A certain part of the brain responsible for overlooking muscle activity takes over other responses of the brain and forces every movement of the body to shut down, including speech.
 - (d) Being quiet has been found to help do away with the dangerous and harmful factors that a person might be facing at that exact moment.
 - (e) None of the above
-
28. Among all the three responses to fear, how does a scream help us in possible dangerous situations?
- (a) The brain processes the scream in a part which helps activate our fight or flight mode which then helps us become aware and scan the situation.
 - (b) Scream can notify the people in your surroundings like your neighbours or anybody in close vicinity to you.
 - (c) When you scream, your vocal cords stretch and become flexible enough to scream louder and warn others of the situation.
